Industrial Refrigeration Best Practices Webinars

**March 27, April 24, and May 29, 2012
All webinars are Noon to 1:30 p.m. (CST)**

Chances are your industrial refrigeration system is the single largest consumer of electricity at your facility. Since it is one of the most durable pieces of equipment, an inefficient system can have a disproportionately large impact on your long-term energy use and operating budget. This three-part webinar will start with a review of the principles of industrial refrigeration systems and identify high-level, energy efficiency improvement opportunities (March webinar). The second and third webinars will explore two, high impact, potential energy efficiency improvement opportunities in greater detail – floating head pressure control (April webinar) and the application for variable frequency drives (May webinar).
