PROTECT YOUR HOME FROM ICE DAMS
When you’re in for home improvement, Wisconsin is in for energy savings.

Ice dams may develop when snow on your roof meets heat escaping through the attic. Not only can they cause structural damage; they’re also a sign of low insulation levels and poor air sealing. FOCUS ON ENERGY® can help you fix the trouble spots and protect your home from wasting heat, energy, and money.

Spot the warning signs
• Icicles on the edge of your roof or gutter
• Ice coming off through the soffit
• Ice forming behind gutters
• Water or ice on exterior wall

If left untreated, ice dams can force water to back up under the shingles and into the ceiling or walls of the house, leading to warped windows, buckling floors, and collapsing drywall or plaster.

Prevention
The best way to prevent ice dams is to identify where your home is leaking air and letting heat escape. That’s where Focus on Energy can help.

Through our Home Performance Program, you can receive a comprehensive home energy assessment to identify any issues, plus incentives for recommended improvements.

Schedule your assessment
Find a Trade Ally contractor to assess your home at focusonenergy.com/wholehome or call 855.339.8866.
